A COMPLETE CONTAINMENT PACKAGE

Our research, combined with that of membrane suppliers, demonstrates that if you use anything other than PVC or TPFE, you will be less than satisfied with your building’s performance. The membrane is what completes the building and maintains a sealed environment. Bring outside work inside and keep it controlled.

Signature’s personnel have experience with a variety of coal tar and benzene contamination sites. Structures have been used for staging, drying of soil, blending and treatment facilities. We work with private contractors, generators and directly with DOE sites.

Air borne contaminants, dust control, noise reduction, and odor control are reasons our clients choose to enclose their project’s excavation area.

Signature’s enclosure system can be equipped with ventilation, air cleaning units, lighting, doors and viewing windows. It is designed to hold a negative pressure. We include flat ends for maximum interior work space and can modify our configuration based on your request.

Why choose Signature?

- Industry Experience
- Non-corrosive Components
- Complete Airtight Enclosures
- Negative Pressure Ready
- Sound Engineering
- Turn-key Packages
- Best Warranty and After Sale Support
- Re-locatable & Crane Lift-able to Meet Site Requirements
- Construction Management
- Maintenance and Upgrade Package for Existing Fabric Structure Owners
- Accessories as required
